

ABSTRACT

The invention relates to a toilet brush having different forms which constitute effective toilet bowl cleaning and hygiene means through the application of a product that is contained inside a portion of the body of said brush, which is squeezed by the user. The aforementioned body is hollow and made from an elastic material. Moreover, each end of said body comprises an open section and each open section is protected with a cover, the outlet section also being sealed by means of a breakable membrane. The invention also comprises an arm having a stepped proximal end which can be screwed to the outlet of the body, thereby causing the membrane to break and connecting the inside of the body with an axial hole in the arm. The axial hole consists of sections having different diameters and runs the length of the arm as far as a head portion which is disposed at the distal end thereof, said head comprising sets of bristles for cleaning operations. An extra piece can be added to the head in order to provide same with an angular configuration that can be used to access normally-inaccessible, concealed areas.
